# Thermo Donut ©

Thermal breaks stop the drainage of temperature and are particularly suitable for metal construction, facade construction, etc.

If the “gets cold” needs to be separated from “must not get cold”, then simply install thermal breaks between the cold side and the warm side!

Different materials, the right one for every application (often high-performance plastic).

e.g. non-combustible, e.g. high compressive strength, ..... etc.

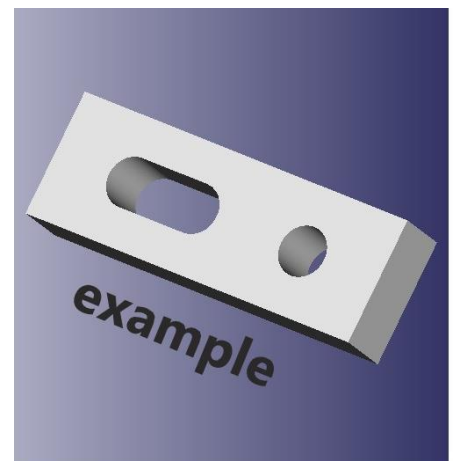

**But always low thermal conductivity !!**

Almost any size is possible

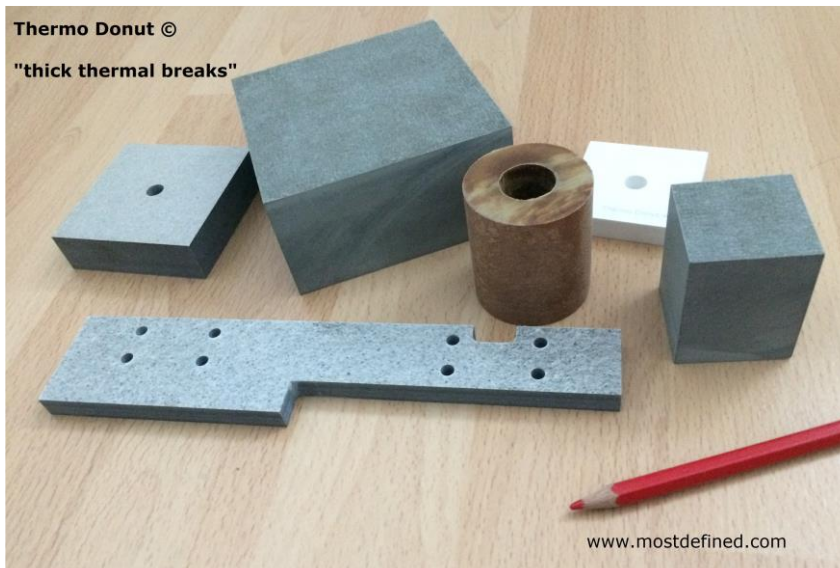

Almost any shape is possible

e.g. also with integrated rubber gasket

Be responsible, build wise!
